

Windows

Zip distribution

1. Make an app.nw zipfile
2. Execute the following command

```
copy /b nw.exe+app.nw app.exe
```

3. Place the new app.exe file in a temp folder and rename to nw.exe
4. Copy all node-webkit DLLs (provided with the node-webkit download) into the temp folder

Do not forget the nw.pak or else it won't work.

5. Repeat step 1 & 2 should you need another app. For each app you'll need a new temp folder since every app.exe has to be renamed to nw.exe.
6. Rename app.exe to a preferred name
7. Copy all DLLs into the current folder

If you're running more than 1 node-webkit executable at once, make sure the following is in the package.json file

```
single-instance: false
```

Enigma VirtualBox

By using Enigma VirtualBox, it's possible to distribute your application without the need of including your DLLs. Here's how to do it:

1. Start Enigma VirtualBox and select your .exe as input file.
2. Include the DLLs in the files folder.
3. Click Process

The result of these steps is a boxed .exe file.

Running multiple executables

When you're trying to run more than one exe file, be sure to start with the nw.exe, otherwise this will result in an error, in this case.
