

Introduction

[tracking.js](#) tracks a certain color from a webcam.

We use it to detect a red helicopter and see if it's in view of the webcam.

Red wasn't available at the time of usage, so we implemented our own color.

Tracking is optional.

Getting started

Usage

```
var videoCamera = new tracking.VideoCamera().render();

videoCamera.track({
  type: 'color',
  color: 'red',
  onNotFound: function (track) {
    // send message
  },
  onFound: function (track) {
    // send message
  }
});
```
